

Stem Cell Treatments for Orthopedic, Autoimmune, Inflammation & Overall Health Conditions

UNLOCK THE POWER OF YOUR OWN CELLS

WHO SHOULD CONSIDER THESE TREATMENTS?

Stem cell therapy is ideal for individuals suffering from joint pain such as knee, hip, shoulder, hand, ankle or elbow. It can offer an alternative, safe and less invasive treatment than surgery. Regenerative medicine has the ability to help you get back to your active lifestyle quicker. Specific conditions that can respond well to treatment include:

- Orthopedic injuries • Musculoskeletal conditions • Osteoarthritis
- Rheumatoid arthritis • Autoimmune conditions • Diminished Overall Health

POTENTIAL BENEFITS OF AUTOLOGOUS (OWN) ADIPOSE-DERIVED STEM CELL TREATMENTS:

- Less invasive as only local anaesthetic is used and a shorter recovery period.
- Lower risk of complications such as bleeding and infection, especially in older patients or those with underlying medical conditions.
- Since it's your own stem cells being used, there is no substantive risk of rejection by the immune system or of disease transmission.

MAXXSTEM

This procedure uses concentrated regenerative cells collected from the individual's bone marrow, fat tissue and blood, which are processed under sterile conditions.

These stem cells can then be injected into the area of the joint needed, such as the knee or shoulder, with minimal discomfort. Stem cell therapy not only initiates the body's repair response, but it also has the capability to repair and regenerate damaged tissues.

ACRS – AUTOLOGOUS CYTOKINE RICH SERUM

The blood is collected and incubated for three hours to stimulate monocytes to produce more cytokines which is immediately injected into the damaged area. This stimulates the natural regeneration process by growth factors.

It's a natural pain relief without taking medications and has anti-inflammatory properties.

PRP – PLATELET RICH PLASMA

These injections offer a revolutionary, minimally invasive way to heal joint injuries. Treatment uses a concentration of the patient's platelets and growth factors from their blood. These are then activated with specific amounts of light exposure and injected directly into the damaged area.

CELL EXTRACT

Adipose-derived stem cell therapy helps promote tissue repair and regeneration. The treatment involves harvesting adipose tissue from the patient through liposuction, which is then processed under sterile conditions and administered intravenously and/or through intra-articular injections.

The adipose cell extract treatment may benefit patients with Rheumatoid Arthritis, Osteoarthritis, Dermatitis (Psoriasis), Bowel Inflammation (Chron's disease and Ulcerative Colitis) and Central Nervous System (Multiple Sclerosis).

In addition, this treatment has helped with Orthopedic Injuries, Autoimmune Diseases and Cardiovascular Disease.

VSELS – VERY SMALL EMBRYONIC LIKE STEM CELLS

Pluripotent cells are found in everyone and are typically activated for healing purposes when the body is under extreme stress, such as low oxygen, low body temperature or significant injuries. This treatment has helped with Inflammation, Autoimmune conditions, Hashimoto's thyroiditis, Rheumatoid arthritis, Pulmonary issues, Musculoskeletal conditions, Osteoporosis, Osteopenia and Ankylosing spondylitis.

The benefits of VSEL treatments may be to increase energy, decrease muscle pain, improve metabolic function, improve cognitive function, and decrease joint pain. VSELS secrete telomerase, which is the enzyme that can create an anti-ageing effect.

The result has been described as 'a shot of youth to the system'. This procedure uses pluripotent stem cells extracted from the patient's blood, administered intravenously, and, in some instances, injected into a damaged area.

With a high success rate and very satisfied patients, our local residents are fortunate enough to have their treatment covered by some of our insurance providers.
